AUSTRALIA

EMBARGO: 11.30AM (CANBERRA TIME) THURS 18 MAY 2017

KEY FIGURES

	Mar 2017	Apr 2017	Mar 17 to Apr 17	Apr 16 to Apr 17
Trend				
Employed persons ('000)	12 051.4	12 071.3	19.9	1.3 %
Unemployed persons ('000)	742.8	744.4	1.7	2.8 %
Unemployment rate (%)	5.8	5.8	0.0 pts	0.1 pts
Participation rate (%)	64.7	64.8	0.0 pts	-0.1 pts
Seasonally Adjusted				
Employed persons ('000)	12 061.9	12 099.3	37.4	1.6 %
Unemployed persons ('000)	751.4	732.3	-19.1	1.3 %
Unemployment rate (%)	5.9	5.7	-0.2 pts	0.0 pts
Participation rate (%)	64.8	64.8	0.0 pts	0.0 pts

KEY POINTS

TREND ESTIMATES (MONTHLY CHANGE)

- Employment increased 19,900 to 12,071,300.
- Unemployment increased 1,700 to 744,400.
- Unemployment rate remained steady at 5.8%.
- Participation rate increased by less than 0.1 pts to 64.8%.
- Monthly hours worked in all jobs decreased 2.0 million hours (0.12%) to 1,663.6 million hours.

SEASONALLY ADJUSTED ESTIMATES (MONTHLY CHANGE)

- Employment increased 37,400 to 12,099,300. Full-time employment decreased 11,600 to 8,227,400 and part-time employment increased 49,000 to 3,871,900.
- Unemployment decreased 19,100 to 732,300. The number of unemployed persons looking for full-time work decreased 12,300 to 514,200 and the number of unemployed persons only looking for part-time work decreased 6,800 to 218,000.
- Unemployment rate decreased by 0.2 pts to 5.7%.
- Participation rate remained steady at 64.8%.
- Monthly hours worked in all jobs decreased 4.3 million hours (0.26%) to 1,659.5 million hours.

IMPACT OF CYCLONE DEBBIE ON ESTIMATES

The damage caused by Cyclone Debbie in Queensland resulted in a marginal increase in the sample loss in the Fitzroy region in April 2017, of less than 20 dwellings. This did not have any observable impact on estimates for Queensland.

ANNUAL SEASONAL RE-ANALYSIS OF QUARTERLY LABOUR FORCE SERIES

The annual seasonal re-analysis of Labour Force series was conducted on estimates up to February 2017 and reflected in the monthly estimates in the March issue. The results will be applied to the quarterly series in the May 2017 issue, to coincide with the next available quarterly data. Improvements in the prior corrections used for quarterly estimates of underemployment and underutilisation will be reflected in revisions to publication tables 20 and 21, and time series spreadsheets 22 and 23.

The quarterly seasonally adjusted employed total, in time series spreadsheet 4 in *Labour Force, Australia, Detailed, Quarterly* (cat. no. 6291.0.55.003) will also be revised to reflect improved correction factors. This will ensure closer alignment with both the sum of the industry divisions, and the monthly employment estimate.

ONLINE COLLECTION IN THE LABOUR FORCE SURVEY

This issue provides an update on online collection in the Labour Force Survey.

ROUNDING

Estimates of changes shown on the front cover and used in the commentary have been calculated using unrounded estimates, and may be different from, but are more accurate than, movement obtained from the rounded estimates. The graphs on the front cover also depict unrounded estimates.

SAMPLING ERROR

The estimates in this publication are based on a sample survey. Published estimates and movements are subject to sampling variability. Standard errors give a measure of sampling variability. The interval bounded by two standard errors is the 95% confidence interval, which provides a way of looking at the variability inherent in estimates. There is a 95% chance that the true value of the estimate lies within that interval.

MOVEMENTS IN SEASONALLY ADJUSTED SERIES BETWEEN MARCH
2017 AND APRIL 2017

	<i>Monthly change</i>	<i>95% Confidence interval</i>		
Total Employment	37 400	-21 600	to	96 400
Total Unemployment	-19 100	-58 500	to	20 300
Unemployment rate	-0.2 pts	-0.6 pts	to	0.2 pts
Participation rate	0.0 pts	-0.4 pts	to	0.4 pts

David W. Kalisch
Australian Statistician

NATIONAL ESTIMATES

TREND ESTIMATES

Australia's trend estimate of employment increased by 19,900 persons in April 2017, with:

- the number of unemployed persons increasing by 1,700 persons;
- the unemployment rate remaining steady at 5.8 per cent;
- the participation rate increasing by less than 0.1 percentage points to 64.8 per cent; and
- the employment to population ratio remaining steady at 61.0 per cent.

Over the past year, trend employment increased by 152,100 persons (or 1.3 per cent), which remains below the average year-on-year growth over the past 20 years (1.8 per cent). Over the same 12 month period the trend employment to population ratio, which is a measure of how employed the population (15 years and over) is, decreased by 0.2 percentage points to 61.0 per cent.

In monthly terms, the trend employment increase of 19,900 persons represented an increase of 0.16 per cent, which was slightly above the monthly average growth rate over the past 20 years of 0.15 per cent.

Trend full-time employment increased by 12,300 persons in April, while part-time employment increased by 7,500 persons. Compared to a year ago, there were 49,300 more persons employed full-time and 102,800 more persons employed part time. The part-time share of employment in the past 12 months increased from 31.5 per cent to 31.9 per cent, and remains close to the historical high of 32.0 per cent in November 2016.

The trend estimate of monthly hours worked in all jobs decreased slightly (by 2.0 million hours) in April 2017, to 1,663.6 million hours.

The trend unemployment rate remained steady at 5.8 per cent in April 2017. It has been relatively stable, at around 5.7 to 5.8 per cent, for almost 18 months. The most recent period with similar stability was May 2007 to October 2008, when it remained at around 4.2 to 4.3 per cent.

Over the past month, unemployed persons increased by 1,700. This was the seventh consecutive increase since September 2016, reflecting an increase of 26,400 unemployed persons.

The trend participation rate increased by less than 0.1 percentage points to 64.8 per cent in April 2017.

The labour force includes the total number of employed and unemployed persons. Over the past year the labour force increased by 172,400 persons (1.4 per cent). This was below the rate of increase in the total Civilian Population aged 15 years and over (310,300 persons, or 1.6 per cent).

The trend participation rate for 15-64 year olds, which controls (in part) for the effects of an ageing population in the older age groups, increased by 0.1 percentage point to 77.1 per cent in April 2017.

The trend participation rate for 15-24 year olds increased 0.1 percentage points to 66.8 per cent in April 2017, though still 0.4 percentage points lower than it was in April 2016. The unemployment rate for this group remained unchanged at 13.0 per cent in April 2017, having increased 0.6 percentage points over the year.

TREND ESTIMATES *continued*

The trend series smooths the more volatile seasonally adjusted estimates and provide the best measure of the underlying behaviour of the labour market.

SEASONALLY ADJUSTED ESTIMATES

Seasonally adjusted employment increased by 37,400 persons from March to April 2017. Changes in the underlying composition of employment reflected a decrease in full-time employment of 11,600 persons, and a 49,000 increase in part-time employment. Since April 2016, seasonally adjusted full-time employment increased by 80,700 persons, while part-time employment increased by 111,300 persons.

Seasonally adjusted monthly hours worked in all jobs decreased slightly in April 2017, by 4.3 million hours, to 1,659.5 million hours.

The seasonally adjusted employment to population ratio increased by 0.1 per cent to 61.1 per cent in April 2017, unchanged from this time last year.

GRAPH 1, EMPLOYMENT TO POPULATION RATIO, PERSONS, April 2007 to April 2017

The seasonally adjusted unemployment rate decreased by 0.2 per cent in April 2017 to 5.7 per cent, and the labour force participation rate remained steady at 64.8 per cent.

STATE AND TERRITORY ESTIMATES

TREND ESTIMATES

In April 2017, increases in trend employment were observed in all states and territories except for South Australia (down 600) and the Australia Capital Territory (down 200). The largest increases were in Queensland (up 6,600 persons) and Victoria (up 6,500 persons).

Increases in employment were also observed in all states and territories over the past 12 months, with the largest increase in Victoria (up 100,100 persons), followed by Queensland (up 14,500 persons) and the Northern Territory (up 9,100 persons).

The trend unemployment rate remained steady in most states and territories from March to April 2017. Western Australia recorded a decrease of 0.1 percentage point to 6.1 per cent. South Australia recorded the highest trend unemployment rate with an increase of 0.1 percentage point to 7.0 per cent.

The trend participation rate increased in the Northern Territory (up 0.3 percentage points), Victoria, Queensland and Tasmania (up 0.1 percentage points). The Australian Capital Territory recorded a decrease in participation (down 0.2 percentage points).

SEASONALLY ADJUSTED ESTIMATES

In seasonally adjusted terms, the largest increase in employment was in Victoria (up 18,600 persons), followed by Western Australia (13,200 persons), Queensland (9,800 persons) and New South Wales (up 9,700 persons). The only decrease in employment was in South Australia (down 5,000 persons).

The largest decreases in the seasonally adjusted unemployment rate were observed in Western Australia (down 0.5 percentage points) and New South Wales (down 0.3 percentage points). The largest increase in the unemployment rate was observed in South Australia (up 0.3 percentage points).

The largest increase in the seasonally adjusted participation rate occurred in Victoria (up 0.3 percentage points), while the largest decrease in the seasonally adjusted participation rate was observed in South Australia (down 0.2 per cent).

Seasonally adjusted estimates are not published for the two territories.

TABLE 1, UNEMPLOYMENT RATE, STATES AND TERRITORIES

	TREND		SEASONALLY ADJUSTED	
	
	March	April	March	April
	%	%	%	%
New South Wales	5.0	5.0	5.0	4.7
Victoria	6.1	6.1	6.1	6.1
Queensland	6.4	6.4	6.3	6.3
South Australia	6.9	7.0	7.0	7.3
Western Australia	6.2	6.1	6.5	5.9
Tasmania	5.8	5.8	6.0	5.9
Northern Territory	3.5	3.5	np	np
Australian Capital Territory	3.7	3.6	np	np
Australia	5.8	5.8	5.9	5.7

np not available for publication but included in totals where applicable, unless otherwise indicated

INSIGHTS FROM THE ORIGINAL DATA

SAMPLE COMPOSITION

The Labour Force Survey sample can be thought of as comprising eight sub-samples (or rotation groups), with each sub-sample remaining in the survey for eight months, and one rotation group "rotating out" each month and being replaced by a new group "rotating in". This sample rotation is important in ensuring that seven-eighths of the sample are common from one month to the next, to ensure that changes in the estimates reflect real changes in the labour market, rather than the sample. In addition, the replacement sample is generally selected from the same geographic areas as the outgoing one, as part of a representative sampling approach.

When considering movements in the original estimates, it is possible to decompose the sample into three components:

- the matched common sample (survey respondents who responded in both March and April);
- the unmatched common sample (respondents in April but who did not respond in March, or vice versa); and
- the incoming rotation group (who replaced respondents who rotated out in March).

The detailed decomposition of each of these movements is included in the data cube 'Insights From the Original Data'.

In considering the three components of the sample, it is important to remember that the matched common sample describes the change observed for the same respondents March and April, while the other two components reflect differences between the aggregate labour force status of different groups of people.

While the rotation groups are designed to be representative of the population, the outgoing and incoming rotation groups will almost always have somewhat different characteristics, as a result of the groups representing a sample of different households and people. The design of the survey, including the weighting and estimation processes, ensures that these differences are generally relatively minor and seeks to ensure that differences in characteristics of rotation groups do not affect the representativeness of the survey and its estimates. Monthly estimates are always designed to be representative of their respective months, regardless of the relative contribution of the three components of the sample.

INCOMING ROTATION GROUP

In original terms, the incoming rotation group in April 2017 had a higher employment to population ratio than the group it replaced (61.1 per cent in March, up to 62.1 per cent in April 2017), and was higher than the ratio for the entire sample (61.3 per cent). Notably, within the incoming rotation group the employment to population ratio for males was higher than the males replaced (66.3 per cent in March, up to 67.8 per cent in April), and above the sample as a whole (67.0 per cent).

The full-time employment to population ratio of the incoming rotation group was also higher than the group it replaced (40.6 per cent in March 2017, up to 42.0 per cent in April 2017), and higher than the ratio for the entire sample (41.5 per cent).

INCOMING ROTATION GROUP continued

The unemployment rate of the incoming rotation group was below the sample as a whole (5.4 per cent, compared to 5.7 per cent), and it replaced a group with a higher rate (5.8 per cent in March). Its participation rate was above that of the sample as a whole (65.7 per cent, compared to 65.0 per cent), and up from the group it replaced (64.8 in March).

OUTGOING ROTATION GROUP

In looking ahead to the May 2017 estimates, the outgoing rotation group in April 2017, which will be replaced by a new incoming rotation group in May 2017, had a lower employment to population ratio (59.5 per cent) compared to the sample as a whole (61.3 per cent). Its full-time employment to population ratio (40.1 per cent) was lower than the ratio for the entire sample (41.5 per cent).

In original terms, the unemployment rate for the outgoing rotation group in April 2017 was 5.7 per cent, which was the same as the whole sample. The participation rate for the outgoing rotation group in April 2017 was 63.1 per cent, which is lower than the rate for the whole sample (65.0 per cent).

THE IMPORTANCE OF TREND DATA

As the gross flows and rotation group data are presented in original terms they are not directly comparable to the seasonally adjusted and trend data discussed elsewhere in the commentary, and are included to provide additional information for the original data. Since the original data are unadjusted, they have a considerable level of inherent sampling variability, which is specifically adjusted for in the trend series. The trend data provide the best measure of the underlying behaviour of the labour market and are the focus of the commentary in this publication.

ONLINE COLLECTION IN THE LABOUR FORCE SURVEY

INTRODUCTION

Households selected in the ABS's Labour Force Survey (LFS) traditionally responded through a telephone or face-to-face interview, but from December 2012 the option of responding through online collection was introduced to incoming rotation groups. This provided respondents with greater choice and ensured that data collection remained cost-effective. Since April 2014, all private dwellings have been provided the option of using the online collection.

This note updates analysis provided in the August 2016 issue of Labour Force, Australia (cat. no. 6202.0) and provides insights into the take up of online collection, and the characteristics of responses by survey mode: telephone interview, face-to-face interview, and online collection.

BACKGROUND

From December 2012 to April 2013, the ABS conducted a trial of online data collection. During this time, households in a single rotation group (i.e. one-eighth of the survey sample) were offered the option of self completing their LFS questionnaire online instead of via a telephone or face-to-face interview.

From May 2013, the ABS expanded the offer of online collection to 50% of each incoming rotation group. From September 2013, online collection has been offered to 100% of households in each incoming rotation group, and by April 2014 100% of LFS households were offered online collection. Interviewer collection (both telephone and face-to-face) continues to be available for households.

The ABS used the initial trial of offering online data collection to a single rotation group and the progressive introduction of the offer to other rotation groups, to measure the impact on the Labour Force series of the move to online data collection. Statistical analysis during this period concluded that there was no evidence of any reporting bias due to the introduction of online collection. Ongoing monitoring and analysis of online responses, has not identified a significant impact from the move to online self completion data collection.

CURRENT COLLECTION PROCEDURES

Households selected in the LFS are sent a letter and brochure informing them that they have been selected to participate in the survey. Since February 2014, survey respondents have been asked to use the unique user name and password provided in the letter to register an email address and other contact details for the household, or to contact the ABS if they are unable to participate in the survey online. A notification is then sent to respondents who have registered their contact details electronically to advise that the survey questionnaire is available for completion online within a specified one week period.

Respondents who are unable to participate in the survey online, along with respondents who register contact details for the household electronically but do not complete the survey questionnaire online within the specified one week period, are subsequently contacted by an ABS interviewer to complete the survey questionnaire either via telephone or face-to-face.

ONLINE COLLECTION IN THE LABOUR FORCE SURVEY *continued*

ONLINE COLLECTION TAKE UP

Online collection take up rates have remained consistent since April 2014 (as can be seen in Graph 1). The highest take up rate during the period was 24.1% in June 2015 and the lowest take up rate was 18.0% in August 2015. In the year ending April 2017, the highest take up rate was 23.9% in March 2017 and the lowest take up rate was 18.7% in August 2016.

GRAPH 1 - MONTHLY ONLINE COLLECTION TAKE UP RATE

Graph 2 shows that capital city respondents continue to show a stronger preference for online response compared with respondents in the rest of the state.

GRAPH 2 - ONLINE COLLECTION TAKE UP RATES, BY CAPITAL CITY/ REST OF STATE

ONLINE COLLECTION TAKE UP *continued*

Graph 3 shows there was also a higher take up of online collection in some states and territories than in others. In the year ending April 2016, Australian Capital Territory average take up rates were the highest in Australia (32.7 per cent), while take up was lowest in the Northern Territory (11.5 per cent). In the year ending April 2017, Australian Capital Territory average take up rates remained the highest in Australia but had decreased by 2.1 percentage points (to 30.6 per cent), while take up in the Northern Territory also remained the lowest, despite increasing by 0.6 percentage points (to 12.1 per cent).

GRAPH 3 - AVERAGE ONLINE COLLECTION TAKE UP RATE

Take up rates by household size show that households with 2 people or more have a stronger preference for online collection, compared with single person households. Take up rates by household size have been relatively consistent in the past two years (as can be seen in Graph 4).

GRAPH 4 - HOUSEHOLD SIZE AND AVERAGE ONLINE COLLECTION RATE

Between May 2016 and April 2017, online collection take up was highest for respondents in their second month in survey, and gradually reduced over the following months (as can be seen in Graph 5). This was seen across all groups (or "panels") who completed their 8 months in the survey between May 2016 and April 2017.

ONLINE COLLECTION IN THE LABOUR FORCE SURVEY *continued*

ONLINE COLLECTION TAKE UP *continued*

GRAPH 5 - AVERAGE ELECTRONIC COLLECTION TAKE UP RATES BY
TIME IN SURVEY, Panels ending May-16 to April-17

Analysis of the characteristics of respondents who choose to respond through online collection (compared with respondents who favour telephone or face-to-face interviews), continued to show that:

- They were more likely to be female;
- They had a relatively higher participation rate;
- They were more likely to be employed; and
- Were more likely to work in higher skilled occupations (especially professionals).

NEXT UPDATE

The next LFS online collection update will be released with the April 2018 issue, in May 2018.

LABOUR FORCE STATUS (AGED 15 YEARS AND OVER), Australia: Trend

WHAT IF...? REVISIONS TO TREND ESTIMATES

EFFECT OF NEW SEASONALLY ADJUSTED ESTIMATES ON TREND ESTIMATES

TREND REVISIONS

Each time new seasonally adjusted estimates become available, trend estimates are revised. This revision is a combined result of the concurrent seasonal adjustment process and the application of surrogates of the Henderson average to the seasonally adjusted series (see paragraphs 28 to 37 of the Explanatory Notes).

The examples in the tables below show two illustrative scenarios and the consequent revisions to previous trend estimates of employment and the unemployment rate. The revisions in the scenarios are due to the use of surrogates of the Henderson average, as the impact of revision of seasonally adjusted estimates can not be estimated in advance.

- (1) The May seasonally adjusted estimate is *higher* than April by:
0.22% for employment
2.26% for the unemployment rate
- (2) The May seasonally adjusted estimate is *lower* than April by:
0.22% for employment
2.26% for the unemployment rate

The percentage changes of 0.22% and 2.26% represent the average absolute monthly percentage changes in employment and the unemployment rate respectively. Estimates in the graphs have been calculated using unrounded estimates, and may be different from, but more accurate than, rounded estimates depicted in the corresponding table.

EMPLOYMENT

		WHAT IF NEXT MONTH'S SEASONALLY ADJUSTED ESTIMATE IS:	
		(1) 12 125.9 i.e. rises by 0.22%	(2) 12 072.7 i.e. falls by 0.22%
Trend as published			
2017

January	5.8	5.8	5.8
February	5.8	5.8	5.8
March	5.8	5.8	5.8
April	5.8	5.8	5.7

EXPLANATORY NOTES

INTRODUCTION

1 This publication contains estimates of the civilian labour force derived from the Labour Force Survey component of the Monthly Population Survey. The full time series for estimates from this publication are also available electronically. More detailed estimates are released one week after this publication in various electronic formats – see Labour Force, Australia, Detailed – Electronic Delivery (cat. no. 6291.0.55.001) and Labour Force, Australia, Detailed, Quarterly (cat. no. 6291.0.55.003).

CONCEPTS, SOURCES AND METHODS

2 The conceptual framework used in Australia's Labour Force Survey aligns closely with the standards and guidelines set out in Resolutions of International Conferences of Labour Statisticians. Descriptions of the underlying concepts and structure of Australia's labour force statistics, and the sources and methods used in compiling the estimates, are presented in Labour Statistics: Concepts, Sources and Methods (cat. no. 6102.0.55.001) which is available on the ABS website <<http://www.abs.gov.au>>.

LABOUR FORCE SURVEY

3 The Labour Force Survey is based on a multi-stage area sample of private dwellings (currently approximately 26,000 houses, flats, etc.), a list sample of non-private dwellings (hotels, motels, etc.), and covers approximately 0.32% of the civilian population of Australia aged 15 years and over.

4 Information is obtained from the occupants of selected dwellings by specially trained interviewers using computer-assisted interviewing, or self-completion online.

5 Households selected for the Labour Force Survey are interviewed each month for eight months, with one-eighth of the sample being replaced each month. The first interview is generally conducted face-to-face. Subsequent interviews are conducted by telephone (if acceptable to the respondent).

6 From December 2012 to April 2013, the ABS conducted a trial of online electronic data collection. Respondents in a single rotation group (i.e. one-eighth of the survey sample) were offered the option of self completing their labour force survey questionnaire online instead of via a face-to-face or telephone interview. From May 2013, the ABS expanded the offer of online electronic collection to 50% of each new incoming rotation group. For more information see the article in the April 2013 issue of this publication. From September 2013, online electronic collection has been offered to 100% of private dwellings in each incoming rotation group. From April 2014, 100% of private dwellings are being offered online electronic collection.

7 The interviews are generally conducted during the two weeks beginning on the Sunday between the 5th and 11th of each month. The information obtained relates to the week before the interview (i.e. the reference week). Each year, to deal with the operational difficulties involved with collecting and processing the Labour Force Survey around the Christmas and New Year holiday period, interviews for December start four weeks after November interviews start (i.e. between the 3rd and 9th December), and January interviews start five weeks after December interviews start. As a result, January interviewing may commence as early as the 7th or as late as the 13th, depending on the year. Occasionally, circumstances that present significant operational difficulties for survey collection can result in a change to the normal pattern for the start of interviewing.

8 Estimates from the Labour Force Survey are usually published first in this publication 39 days after the commencement of interviews for that month, with the exception of estimates for each December which are usually published 46 days after the commencement of interviews.

EXPLANATORY NOTES *continued*

SCOPE OF SURVEY

9 The Labour Force Survey includes all persons aged 15 years and over except members of the permanent defence forces, certain diplomatic personnel of overseas governments customarily excluded from census and estimated population counts, overseas residents in Australia, and members of non-Australian defence forces (and their dependants) stationed in Australia.

COVERAGE

10 In the Labour Force Survey, coverage rules are applied which aim to ensure that each person is associated with only one dwelling, and hence has only one chance of selection. The coverage rules are necessarily a balance between theoretical and operational considerations. Nevertheless, the chance of a person being enumerated at two separate dwellings in the survey is considered to be negligible.

POPULATION BENCHMARKS

11 The Labour Force Survey estimates are calculated in such a way as to add to independent estimates of the civilian population aged 15 years and over (population benchmarks). These population benchmarks are based on the most recently released estimates of Final, Revised and Preliminary quarterly Estimated Resident Population (ERP). For information on the methodology used to produce the ERP see Australian Demographic Statistics (cat. no. 3101.0). Since the most recently released ERP estimates lag the current time period for Labour Force estimates by nine months, the Labour Force population benchmarks are created by projecting forward three quarters past the most recently released quarterly ERP estimates. The projection is based on the historical pattern of each population component – births, deaths, interstate migration and net overseas migration (NOM). Projected estimates of NOM are supplemented with other data sources to better forecast population changes in the short-term. The main data source is the forecasts published by the Department of Immigration & Border Protection in the publication *The Outlook for Net Overseas Migration*.

12 Commencing in March 2010, the ERP series has been revised twice-yearly, in the March and September quarter issues of *Australian Demographic Statistics* (cat. no. 3101.0). This biannual revision cycle incorporates more up to date information available for NOM. This updated information is included in the population benchmarks used in creating the Labour Force estimates when they are rebenchmarked.

13 Every five years, the ERP series are revised to incorporate additional information available from the latest Census of Population and Housing (Census). Labour Force Survey population benchmarks, and the estimates, are revised following this five-yearly revision in the ERP. The process of incorporating the revised population benchmarks is referred to as 'rebasings'. From the January 2014 issue of this publication, labour force estimates have been compiled using population benchmarks based on the results of the 2011 Census. Revisions were made to historical Labour Force estimates from June 2006 to December 2013. In addition, estimates from July 1991 to May 2006 were revised to reflect population benchmarks based on ERP revised following the 2011 Census. The next rebasing based on the Census will be following the release of the 2016 Census-based ERP estimates, which will incorporate revisions back five years. For more information on revised ERP estimates, refer to the June 2012 issue of *Australian Demographic Statistics* (cat. no. 3101.0) released in December 2012.

14 In between Censuses, the ABS revises the Labour Force population benchmarks using the latest ERP according to the paragraphs above. These were introduced in the July 2010, November 2012 and April 2013 issues. The revisions planned for the October 2013, April 2014 and November 2014 issues were not implemented (see What's New in the Labour Force in the September 2013 issue and *Changes in this Issue* in the October 2014 issue of this publication). From the February 2015 issue, rebenchmarking will be undertaken quarterly in the February, May, August and November issues, apart from May 2015. For more information, refer to the article Rebenchmarking of Labour Force Series in the February 2015 issue of this publication.

EXPLANATORY NOTES *continued*

ESTIMATION METHOD

15 The estimation method used in the Labour Force Survey is Composite Estimation, which was introduced in May 2007. In January 2014 composite estimation was applied to all estimates from July 1991 as part of the 2011 Census rebenchmarking. Composite Estimation combines data collected in the previous six months with current month's data to produce the current month's estimates, thereby exploiting the high correlation between overlapping samples across months in the Labour Force Survey. The Composite Estimator combines the previous and current months' data by applying different factors according to length of time in the survey. After these factors are applied, the seven months of data are weighted to align with current month population benchmarks. For details see Information Paper: Forthcoming Changes to Labour Force Statistics, 2007 (cat. no. 6292.0).

COMPARABILITY OF SERIES

16 From April 1986, the definition of employed persons was changed to include persons who worked without pay between 1 and 14 hours per week in a family business or on a farm (i.e. contributing family workers). For further information, see paragraphs 22 and 23 of the Explanatory Notes in the February 2003 issue of Labour Force, Australia (cat. no. 6203.0).

17 The ABS introduced telephone interviewing into the Labour Force Survey in August 1996. Implementation was phased in for each new sample group from August 1996 to February 1997. During the period of implementation, the new method produced different estimates than would have been obtained under the old methodology. The effect dissipated over the final months of implementation and was no longer discernible from February 1997. The estimates for February 1997 and onwards are directly comparable to estimates for periods prior to August 1996. For further details, see the feature article in the June 1997 issue of Labour Force, Australia (cat. no. 6203.0).

18 From April 2001 the Labour Force Survey was conducted using a redesigned questionnaire containing additional data items and some minor definitional changes. The definition of unemployed persons was changed to include all persons who were waiting to start work and were available to start in the reference week. This change was introduced in February 2004, when historical unit record data were revised from April 2001 to January 2004. This revision created a small trend break at April 2001 in unemployed persons and unemployment rate series. For further details, see Information Paper: Forthcoming Changes to Labour Force Statistics, 2003 (cat. no. 6292.0), released in December 2003. From July 2014 the Labour Force Survey questionnaire was further redesigned and definitional changes made to active job search steps and duration of job search. For further details, see the Glossary and Information Paper: Forthcoming Changes to Labour Force Statistics, June 2014 (cat. no. 6292.0), released in October 2014.

19 Core labour force series were revised in April 2001 for the period April 1986 to March 2001 for the remaining definitional changes introduced with the redesigned questionnaire, to reduce the impact of the changes on labour force series. For further details, see Information Paper: Implementing the Redesign Labour Force Survey Questionnaire (cat. no. 6295.0) and the 2004 issue of Information Paper: Questionnaires Used in the Labour Force Survey (cat. no. 6232.0).

20 In May 2007, an improved method of estimation, known as composite estimation, was introduced into the Labour Force Survey. In introducing this change, the ABS revised unit record data from April 2001 to April 2007 based on the new estimation method. No change was identified in the trend breaks in the unemployed persons and unemployment rate series which arose with the introduction of a redesigned survey form in April 2001 (as noted above in paragraph 18). In January 2014 composite estimation was applied to all estimates from July 1991 as part of the 2011 Census rebenchmarking. For further details, see Information Paper: Forthcoming Changes to Labour Force Statistics, 2007 (cat. no. 6292.0).

EXPLANATORY NOTES *continued*

COMPARABILITY OF SERIES

continued

21 As one of a range of ABS savings initiatives for the 2008–09 financial year, there was a 24% reduction in the LFS sample size for the period July 2008 to August 2009, relative to the June 2008 sample size. The sample reduction was reversed from September 2009 to December 2009, with December 2009 estimates being the first produced under the fully reinstated sample.

LABOUR FORCE SURVEY SAMPLE

22 The current Labour Force Survey sample has been selected using information collected in the 2011 Census of Population and Housing.

23 The sample was introduced over four months – May 2013 to August 2013. Two rotation groups (i.e. one-quarter of the survey sample) were introduced each month. During the sample phase-in, the increased sample rotation had an impact on the quality of estimates. Movement standard errors increased by approximately 10%, representing, for example, an increase on the standard error on the Australian monthly change in employment for May 2013 from 27,000 to approximately 29,700.

24 Due to the use of composite estimation, there was a marginal impact on the quality of level estimates. Gross Flows analysis were impacted by the sample phase-in with between 60% to 70% of the sample available for matching between the current and previous months instead of the usual 80%. After full transition to the new sample, the quality of level and movement estimates is at the level designed for under the 2011 sample design and are of similar quality as the 2006 sample design. For further details, see *Information Paper: Labour Force Survey Sample Design* (cat. no. 6269.0) released on 30 May 2013.

RELIABILITY OF ESTIMATES

25 Two types of error are possible in an estimate based on a sample survey: sampling error and non-sampling error.

26 Sampling error occurs because a sample, rather than the entire population, is surveyed. One measure of the likely difference resulting from not including all dwellings in the survey is given by the standard error. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included in the survey, and about nineteen chances in twenty that the difference will be less than two standard errors. Standard errors of key estimates for the latest month and of movements since the previous month of these estimates are shown in the standard errors section of this publication. Standard errors for other estimates and other movements may be calculated by using the spreadsheet contained in Labour Force Survey Standard Errors, Data Cube (cat. no. 6298.0.55.001) which is available free of charge on the ABS website <<http://www.abs.gov.au>>.

27 Non-sampling error arises from inaccuracies in collecting, recording and processing the data. Every effort is made to minimise reporting error by the careful design of questionnaires, intensive training and supervision of interviewers, and efficient data processing procedures. Non-sampling error also arises because information cannot be obtained from all persons selected in the survey. The Labour Force Survey receives a high level of co-operation from individuals in selected dwellings, with the average response rate over the past year being 93%. See Glossary for definition of response rate.

SEASONAL ADJUSTMENT AND TREND ESTIMATION

28 Any original time series can be thought of as a combination of three broad and distinctly different types of behaviour, each representing the impact of certain types of real world events on the information being collected: systematic calendar related events, short-term irregular fluctuations and long-term cyclical behaviour. A multiplicative decomposition model is applied in the seasonal adjustment of Labour Force Time Series, where the original time series (O) is considered as the product of the underlying trend (T), a systematic calendar related or seasonal component (S) and an irregular component (I). This can be expressed as $O = T \times S \times I$. The contributions of each of these

EXPLANATORY NOTES *continued*

SEASONAL ADJUSTMENT AND TREND ESTIMATION *continued*

behaviours varies from series to series, as well as throughout time for a given series, depending on the nature of the interactions of real world events and the data of interest.

29 Seasonal adjustment is a statistical technique that attempts to measure and remove the effects of systematic calendar related patterns including seasonal variation to reveal how a series changes from period to period. Seasonal adjustment does not aim to remove the irregular or non-seasonal influences which may be present in any particular month. This means that month-to-month movements of the seasonally adjusted estimates may not be reliable indicators of trend behaviour.

30 The Labour Force Survey uses the concurrent seasonal adjustment method to derive seasonal factors. Concurrent seasonal adjustment uses data up to the current month to estimate seasonal factors for the current and all previous months. This process can result in revisions each month to estimates for earlier periods. However, in most instances, the only noticeable revisions will be to the seasonally adjusted estimates for the previous month and one year prior to the current month. From the March 2015 issue of this publication, the effects of supplementary surveys are removed prior to the estimation of seasonal factors for key Labour Force series from February 1978 onwards. While this methodology has addressed short term volatility in the seasonally adjusted series arising from changes to the timing and content of the supplementary survey program, in general prior corrections and resulting changed seasonal patterns can be identified and measured to a more reliable degree of certainty after three successive observations (in this case after three years). For further details refer to the October and December 2014 issues of this publication.

31 The revision properties of the seasonally adjusted and trend estimates can be improved by the use of Autoregressive Integrated Moving Average (ARIMA) modelling. ARIMA modelling relies on the characteristics of the series being analysed to project future period data. The projected values are temporary, intermediate values, that are only used internally to improve the estimation of the seasonal factors. The projected data do not affect the original estimates and are discarded at the end of the seasonal adjustment process. The Labour Force Survey uses an ARIMA model for the majority of the individual time series. The ARIMA model is assessed as part of the annual reanalysis. For further details, see the feature article in the October 2004 issue of *Australian Economic Indicators* (cat. no. 1350.0).

32 Seasonal adjustment is able to remove the effect of events which occur at the same time in the survey every year. However, there are some events, like holidays, which are not always at the same time in the survey cycle or which are not at the same time across Australia. The effects of these types of events on Labour Force Survey estimates cannot in all cases be removed, because the pattern of their effects cannot be determined. However, two events for which adjustment is made in the seasonally adjusted series are the January interview start date and the timing of Easter. For further details, see *Information Paper: Forthcoming Changes to Labour Force Statistics* (cat. no. 6292.0) released in December 2003.

33 While seasonal factors for the complete time series are estimated each month, they will continue to be reviewed annually at a more detailed level to take into account each additional year's original data. This annual review will not normally result in significant changes to published estimates. The review is usually conducted early each year with the results released in this publication shortly thereafter.

34 The smoothing of seasonally adjusted series to produce 'trend' series reduces the impact of the irregular component of the seasonally adjusted series. These trend estimates are derived by applying a 13-term Henderson-weighted moving average to all months except the last six. The last six monthly trend estimates are obtained by applying

EXPLANATORY NOTES *continued*

SEASONAL ADJUSTMENT AND TREND ESTIMATION *continued*

surrogates of the Henderson average to the seasonally adjusted series. Trend estimates are used to analyse the underlying behaviour of a series over time.

35 While this smoothing technique enables estimates to be produced for the latest month, it does result in revisions in addition to those caused by the revision of seasonally adjusted estimates. Generally, revisions due to the use of surrogates of the Henderson average become smaller, and after three months have a negligible impact on the series.

36 Trend estimates are published for the Northern Territory in table 10 and for the Australian Capital Territory in table 11. Unadjusted series for the two Territories have shown, historically, a high degree of variability, which can lead to considerable revisions to the seasonally adjusted estimates each month when seasonal factors are estimated. For this reason, seasonally adjusted estimates are not currently published for the two Territories. In addition, caution should be exercised in the interpretation of trend estimates for the two Territories, particularly for the three most recent months, where revisions may be relatively large.

37 For further information, see *A Guide to Interpreting Time Series – Monitoring Trends* (cat. no. 1349.0).

DATA AVAILABLE ON REQUEST

40 As well as the statistics included in this and related publications, the ABS may have other relevant data available. Inquiries should be made to the Labour Force contact officer on (02) 6252 6525, email <labourforce@abs.gov.au> or to any ABS office.

EFFECTS OF ROUNDING

41 Estimates have been rounded and discrepancies may occur between sums of the component items and totals. Estimates of movement shown in this publication are obtained by taking the difference of unrounded estimates. The movement estimate is then rounded. Where a discrepancy occurs between the reported movement and the difference of the rounded estimates, the reported movement will be more accurate.

SYMBOLS AND ABBREVIATIONS

42 SYMBOLS AND ABBREVIATIONS

<i>Symbol</i>	<i>Definition</i>
'000	thousands
%	percentage
ABS	Australian Bureau of Statistics
CAI	computer assisted interviewing
cat. no.	catalogue number
Civ. pop.	civilian population
ERP	estimated resident population
Emp. to pop. ratio	employment to population ratio
f/t	full time
LFS	Labour Force Survey
NILF	not in the Labour Force
Part. rate	participation rate
p/t	part time
pts	percentage points
Seas adj.	seasonally adjusted
TAFE	Technical and Further Education
Unemp. rate	unemployment rate

STANDARD ERRORS

STANDARD ERRORS

The estimates in this publication are based on information gained from the occupants of a sample survey of dwellings. Because the entire population is not surveyed, the published original, seasonally adjusted and trend estimates are subject to sampling error. The most common way of quantifying such sampling error is to calculate the standard error for the published estimate or statistic. For more information, see paragraphs 25 to 27 of the Explanatory Notes.

LEVEL ESTIMATES

To illustrate, let us say the published level estimate for employed persons aged 15–19 years is 700,000 and the associated standard error is 9,000. The standard error is then used to interpret the level estimate of 700,000. For instance, the standard error of 9,000 indicates that:

- There are approximately two chances in three that the real value falls within the range 691,000 to 709,000 ($700,000 \pm 9,000$)
- There are approximately nineteen chances in twenty that the real value falls within the range 682,000 to 718,000 ($700,000 \pm 18,000$).

The real value in this case is the result we would obtain if we could enumerate the total population.

The following table shows the standard errors for this month's level estimates.

										AUSTRALIA		
										Males	Females	Persons
										</		

STANDARD ERRORS *continued*

MOVEMENT ESTIMATES

The following example illustrates how to use the standard error to interpret a movement estimate. Let us say that one month the published level estimate for females employed part-time in Australia is 1,890,000; the next month the published level estimate is 1,900,000 and the associated standard error for the movement estimate is 11,900. The standard error is then used to interpret the published movement estimate of 10,000. For instance, the standard error of 11,900 indicates that:

- There are approximately two chances in three that the real movement between the two months falls within the range – 1,900 to 21,900 (10,000 + or – 11,900)
- There are approximately nineteen chances in twenty that the real movement falls within the range – 13,800 to 33,800 (10,000 + or – 23,800).

The following table shows the standard errors for this month's movement estimates.

GLOSSARY

Actively looked for work	<p>Actively looked for work includes:</p> <ul style="list-style-type: none"> ■ written, telephoned or applied to an employer for work; ■ had an interview with an employer for work; ■ answered an advertisement for a job; ■ checked or registered with an employment agency; ■ taken steps to purchase or start your own business; ■ advertised or tendered for work; and ■ contacted friends or relatives in order to obtain work.
Actual hours of work	<p>Actual hours of work refers to a specified reference period (e.g. a week) and includes:</p> <ul style="list-style-type: none"> ■ hours actually worked during normal periods of work; ■ time spent in addition to hours worked during normal periods of work (including overtime); ■ time spent at the place of work on activities such as the preparation of the workplace, repairs and maintenance, preparation and cleaning of tools, and the preparation of receipts, time sheets and reports; ■ time spent at the place of work waiting or standing by due to machinery or process breakdown, accident, lack of supplies, power or internet access, etc; ■ time corresponding to short rest periods (resting time) including tea and coffee breaks or prayer breaks; ■ travel time connected to work (excluding commuting time); and ■ training and skills enhancement related to the job or employer. <p>Excluded are:</p> <ul style="list-style-type: none"> ■ hours paid for but not worked, such as paid annual leave, public holidays or paid sick leave; ■ meal breaks (e.g. lunch breaks); ■ paid and unpaid time 'on call'; ■ time spent on travel to and from work when no productive activity for the job is performed (e.g. commuting time); and ■ time off during working hours to attend outside educational activities, even if it is authorised, e.g. those not connected to the job or employer. <p>For multiple job holders the LFS collects a separate measure of actual hours worked in main job and in all jobs.</p>
Attending full time education	Persons aged 15-24 years enrolled at secondary or high school or enrolled as a full time student at a Technical and Further Education (TAFE) college, university, or other educational institution in the reference week.
Attending school	Persons aged 15-19 years enrolled at secondary or high school in the reference week.
Attending tertiary educational institution full time	Persons aged 15-24 years enrolled full time at a TAFE college, university, or other educational institution in the reference week, except those persons aged 15-19 years who were still attending school.
Civilian population aged 15 years and over	All usual residents of Australia aged 15 years and over except members of the permanent defence forces, certain diplomatic personnel of overseas governments customarily excluded from census and estimated population counts, overseas residents in Australia, and members of non-Australian defence forces (and their dependants) stationed in Australia.
Composite Estimation	The estimation methodology used in the Labour Force Survey. Composite Estimation uses sample responses from nearby months as well as from the reference month to derive estimates for the reference month. This approach achieves gains in efficiency by exploiting the high similarity between the responses provided by the same respondent in previous months. For details see Information Paper: Forthcoming Changes to Labour Force Statistics, 2007 (cat. no. 6292.0).
Employed	All persons aged 15 years and over who met one of the following criteria during the

GLOSSARY *continued*

Employed <i>continued</i>	<p>reference week:</p> <ul style="list-style-type: none"> ■ Worked for one hour or more for pay, profit, commission or payment in kind, in a job or business or on a farm (employees and owner managers of incorporated or unincorporated enterprises). ■ Worked for one hour or more without pay in a family business or on a farm (contributing family workers). ■ Were employees who had a job but were not at work and were: <ul style="list-style-type: none"> ■ away from work for less than four weeks up to the end of the reference week; or ■ away from work for more than four weeks up to the end of the reference week and received pay for some or all of the four week period to the end of the reference week; or ■ away from work as a standard work or shift arrangement; or ■ on strike or locked out; or ■ on workers' compensation and expected to return to their job. ■ Were owner managers who had a job, business or farm, but were not at work.
Employed full-time	Includes employed persons who usually worked 35 hours or more a week (in all jobs) and those who, although usually working less than 35 hours a week, worked 35 hours or more during the reference week.
Employed part-time	Includes employed persons who usually worked less than 35 hours a week (in all jobs) and either did so during the reference week, or were not at work in the reference week.
Employment to population ratio	For any group, the number of employed persons expressed as a percentage of the civilian population in the same group.
Estimated resident population (ERP)	Estimated resident population (ERP), is Australia's official measure of the population of Australia and is based on the concept of usual residence. It refers to all people, regardless of nationality, citizenship or legal status, who usually live in Australia, with the exception of foreign diplomatic personnel and their families. It includes usual residents who are overseas for fewer than 12 months. It excludes overseas visitors who are in Australia for fewer than 12 months. Refer to Australian Demographic Statistics (cat. no. 3101.0).
Flow estimates	Flow estimates are a measure of activity over a given period. For example, monthly hours worked in all jobs is a measure of the total number of hours worked in a calendar month.
Gross flows	<p>The matching of respondents who report in consecutive months enables analysis of the transition of individuals between the different labour force status classifications, referred to as the matched sample. The transition counts between the different labour force status classifications from one point in time to the next are commonly referred to as gross flows.</p> <p>The figures presented in gross flows are presented in original terms only and do not align with published labour force estimates. The gross flows figures are derived from the matched sample between consecutive months, which after taking account of the sample rotation and varying non-response in each month is approximately 80 percent of the sample.</p> <p>Caution should be exercised when analysing these gross flows data due to:</p> <ul style="list-style-type: none"> ■ the figures presented sum to approximately 80 percent of the population values as the gross flows data are based on the matched sample only; ■ there is no adjustment applied to account for changes due to seasonal patterns (referred to commonly as seasonal adjustment); and ■ the estimates of relative sizes of each transition class are subject to bias due to the matched sample being a non-representative sample.
Labour force	For any group, persons who were employed or unemployed, as defined.

GLOSSARY *continued*

Labour force status	A classification of the civilian population aged 15 years and over into employed, unemployed or not in the labour force, as defined. The definitions conform closely to the international standard definitions adopted by the International Conferences of Labour Statisticians.
Long-term unemployed	The number of persons unemployed for 52 weeks or over.
Long-term unemployment ratio	The number of long-term unemployed persons, expressed as a percentage of the total unemployed population.
Market sector	The market sector is an industry grouping comprising the following industries: Agriculture, forestry and fishing; Mining; Manufacturing; Electricity, gas, water and waste services; Construction; Wholesale trade; Retail trade; Accommodation and food services; Transport, postal and warehousing; Information media and telecommunications; Finance and insurance services; Rental, hiring and real estate services; Professional, scientific and technical services; Administrative and support services; Arts and recreation services; and Other services. Refer to Australian National Accounts: Concepts, Sources and Methods (cat. no. 5216.0).
Non-market Sector	The non-market sector is an industry grouping comprising the following industries: Education and training; Public administration & safety; and Health care and social assistance. Refer to Australian National Accounts: Concepts, Sources and Methods (cat. no. 5216.0).
Monthly hours worked in all jobs	<p>Monthly hours worked in all jobs measures the total number of actual hours worked by employed persons in a calendar month. It differs from the actual hours worked estimates (and the usual hours worked estimates) since these refer only to the hours worked in the reference week.</p> <p>The methodology used to produce monthly hours worked in all jobs means that these are synthetic estimates. Seasonally adjusted and trend estimates of monthly hours worked in all jobs are available for the period July 1978 onwards.</p> <p>Further information on the methodology used to produce the monthly hours worked in all jobs estimates is available on the ABS website in Information Paper: Expansion of Hours Worked Estimates from the Labour Force Survey (cat. no. 6290.0.55.001).</p> <p>Actual and usual hours worked cannot be aggregated across time to produce either quarterly or annual estimates as they relate to only a single week in the month. In contrast, monthly hours worked in all jobs estimates are a true monthly measure, and may be aggregated across time to produce both quarterly and annual estimates.</p>
Not in labour force	Persons who were not in the categories employed or unemployed, as defined. They include people who undertook unpaid household duties or other voluntary work only, were retired, voluntarily inactive and those permanently unable to work.
Participation rate	For any group, the labour force expressed as a percentage of the civilian population aged 15 years and over in the same group.
Response rate	The number of fully responding dwellings expressed as a percentage of the total number of dwellings excluding sample loss. Examples of sample loss include: dwellings where all persons are out of scope and/or coverage; vacant dwellings; dwellings under construction; dwellings converted to non-dwellings; derelict dwellings; and demolished dwellings.
Seasonally adjusted series	A time series of estimates with the estimated effects of normal seasonal variation removed. See Explanatory Notes for more detail.
Stock estimates	Stock estimates are a measure of certain attributes at a point in time and can be thought of as stocktakes. For example, the total number of employed persons is an account of the number of people who were considered employed in the Labour Force Survey reference week.

GLOSSARY *continued*

Trend series	A smoothed seasonally adjusted series of estimates. See Explanatory Notes for more detail.
Underemployment rate (proportion of labour force)	The number of underemployed workers expressed as a percentage of the labour force.
Underemployment ratio (proportion of employed)	The number of underemployed workers expressed as a percentage of total employed persons.
Underemployed workers	<p>Employed persons aged 15 years and over who want, and are available for, more hours of work than they currently have. They comprise:</p> <ul style="list-style-type: none"> ■ persons employed part time who want to work more hours and are available to start work with more hours, either in the reference week or in the four weeks subsequent to the survey; or ■ persons employed full time who worked part time hours in the reference week for economic reasons (such as being stood down or insufficient work being available). It is assumed that these people wanted to work full time in the reference week and would have been available to do so.
Underutilisation rate	The sum of the number of persons unemployed and the number of persons in underemployment, expressed as a proportion of the labour force.
Unemployed	<p>Persons aged 15 years and over who were not employed during the reference week, and:</p> <ul style="list-style-type: none"> ■ had actively looked for full time or part time work at any time in the four weeks up to the end of the reference week and were available for work in the reference week; or ■ were waiting to start a new job within four weeks from the end of the reference week and could have started in the reference week if the job had been available then.
Unemployed looked for full time work	<p>Unemployed persons who:</p> <ul style="list-style-type: none"> ■ actively looked for full time work; or ■ were waiting to start a new full time job.
Unemployed looked for only part time work	<p>Unemployed persons who:</p> <ul style="list-style-type: none"> ■ actively looked for part time work only; or ■ were waiting to start a new part time job.
Unemployment rate	For any group, the number of unemployed persons expressed as a percentage of the labour force in the same group.
Usual hours of work	Usual hours of work refers to a typical period rather than the hours worked in a specified reference period. The concept of usual hours applies both to persons at work and to persons temporarily absent from work, and is defined as the hours worked during a typical week or day. Actual hours worked (for a specific reference period) may differ from usual hours worked due to illness, vacation, strike, overtime work, a change of job, or similar reasons.
